Lab Assignment # 11.3

Program	: B. Tech (CSE)
Specialization	: -
Course Title	: AI Assisted Coding
Course Code	: 23CS002PC304
Semester	II
Academic Session	: 2025-2026
Name of Student	: V.AmruthSagar
Enrollment No.	: 2403A51L44
Batch No.	52
Date	: 24/02/26

Submission Starts here**Screenshots:****Task Description #1**

Smart Contact Manager (Arrays & Linked Lists)

Scenario

SR University's student club requires a simple Contact Manager Application to store members' names and phone numbers. The system should support efficient addition, searching, and deletion of contacts. **Tasks**

1. Implement the contact manager using arrays (lists).
2. Implement the same functionality using a linked list for dynamic memory allocation.
3. Implement the following operations in both approaches:
 - o Add a contact
 - o Search for a contact
 - o Delete a contact
4. Use GitHub Copilot to assist in generating search and delete methods.
5. Compare array vs. linked list approaches with respect to:
 - o Insertion efficiency
 - o Deletion efficiency

Expected Outcome

- Two working implementations (array-based and linked-list-based).
- A brief comparison explaining performance differences.

```

ai_coding.py > % ArrayContactManager > delete_contact
1  # Smart Contact Manager (Arrays & Linked Lists)
2  # Scenario
3  # SR University's student club requires a simple Contact Manager Application
4  # to store members' names and phone numbers. The system should support
5  # efficient addition, searching, and deletion of contacts.
6  # Tasks
7  # 1. Implement the contact manager using arrays (lists).
8  # 2. Implement the same functionality using a linked list for dynamic
9  # memory allocation.
10 # 3. Implement the following operations in both approaches:
11 # o Add a contact
12 # o Search for a contact
13 # o Delete a contact
14 # 4. Use GitHub Copilot to assist in generating search and delete methods.
15 # 5. Compare array vs. linked list approaches with respect to:
16 # o Insertion efficiency
17 # o Deletion efficiency
18 # Expected Outcome
19 # • Two working implementations (array-based and linked-list-based).
20 # • A brief comparison explaining performance differences.
21 # Array-based Contact Manager
22 class ArrayContactManager:
23     def __init__(self):
24         self.contacts = []
25

70                 if prev:
```

```

ai_coding.py / ArrayContactManager / delete_contact
48 class LinkedListContactManager:
65     def delete_contact(self, name):
66         current = self.head
67         prev = None
68         while current:
69             if current.name == name:
70                 if prev:
71                     prev.next = current.next
72                 else:
73                     self.head = current.next
74                 return True
75             prev = current
76             current = current.next
77         return False
78 # Performance Comparison
79 # Insertion Efficiency:
80 # - Array-based: O(1) for appending a contact.
81 # - Linked List-based: O(1) for adding a contact at the head.
82 # Deletion Efficiency:
83 # - Array-based: O(n) in the worst case (if the contact is at the end).
84 # - Linked List-based: O(n) in the worst case (if the contact is at the end).
85 # Overall, both approaches have similar time complexities for insertion and deletion, but the linked list can be more memory efficient for large data.
86
87 # Example Usage
88 if __name__ == "__main__":
89     # Using ArrayContactManager
90     array_manager = ArrayContactManager()
91     array_manager.add_contact("Alice", "1234567890")
92     array_manager.add_contact("Bob", "0987654321")
93     print(array_manager.search_contact("Alice")) # {'name': 'Alice', 'phone': '1234567890'}
94     print(array_manager.delete_contact("Bob")) # True
95     print(array_manager.search_contact("Bob")) # None
96
97     # Using LinkedListContactManager
98     linked_list_manager = LinkedListContactManager()

```

Output:

```

ai_coding.py / ArrayContactManager / delete_contact
90 array_manager = ArrayContactManager()
91 array_manager.add_contact("Alice", "1234567890")
92 array_manager.add_contact("Bob", "0987654321")
93 print(array_manager.search_contact("Alice")) # {'name': 'Alice', 'phone': '1234567890'}
94 print(array_manager.delete_contact("Bob")) # True
95 print(array_manager.search_contact("Bob")) # None
96
97 # Using LinkedListContactManager
98 linked_list_manager = LinkedListContactManager()
99 linked_list_manager.add_contact("Charlie", "5555555555")
100 linked_list_manager.add_contact("Dave", "4444444444")
101 print(linked_list_manager.search_contact("Charlie")) # {'name': 'Charlie', 'phone': '5555555555'}
102 print(linked_list_manager.delete_contact("Dave")) # True
103 print(linked_list_manager.search_contact("Dave")) # None

True
None
PS C:\Users\Eshwar\OneDrive\Desktop\python>

```

EXPLANATION:

1. Array version is simple and memory efficient.
2. Linked list version is flexible and faster for insertions/deletions (especially at beginning).
3. Both structures take $O(n)$ time for searching.

Task 2: Library Book Search System (Queues & Priority Queues)

Scenario

The SRU Library manages book borrow requests. Students and faculty submit requests, but faculty requests must be prioritized over student requests.

Tasks

1. Implement a Queue (FIFO) to manage book requests.
2. Extend the system to a Priority Queue, prioritizing faculty requests.
3. Use GitHub Copilot to assist in generating:
 - o enqueue() method
 - o dequeue() method
4. Test the system with a mix of student and faculty requests.

Expected Outcome

- Working queue and priority queue implementations.
- Correct prioritization of faculty requests

```
ai_coding.py > ...

Faculty request for 'Artificial Intelligence: A Modern Approach'
Student request for 'Introduction to Algorithms'
Student request for 'Data Structures in Python'
PS C:\Users\Eshwar\OneDrive\Desktop\python> █

```

EXPLANATION:

1. Queue → serves requests in arrival order.
2. Priority Queue → serves based on importance.
3. Faculty are assigned **higher priority value**, so they are processed first.
4. A counter is used to maintain order when priorities are equal.

Task 3: Emergency Help Desk (Stack Implementation)

Scenario

SR University's IT Help Desk receives technical support tickets from students and staff. While tickets are received sequentially, issue escalation follows a Last-In, First-Out (LIFO) approach.

Tasks

1. Implement a Stack to manage support tickets.
2. Provide the following operations:
 - o push(ticket)
 - o pop()
 - o peek()
3. Simulate at least five tickets being raised and resolved.
4. Use GitHub Copilot to suggest additional stack operations such as:
 - o Checking whether the stack is empty

o Checking whether the stack is full (if applicable)

Expected Outcome

- Functional stack-based ticket management system.
- Clear demonstration of LIFO behavior.

```

47 help_desk.peek()
48 help_desk.pop()
49 help_desk.pop()
50 help_desk.pop()
51 help_desk.pop() # Attempting to pop from an empty stack
52 help_desk.is_empty()
53 help_desk.is_full()
54
55

```

Output:

```

Ticket 'Ticket 4: Printer not working' added to the stack.
Ticket 'Ticket 5: Email not syncing' added to the stack.
Next ticket to resolve: 'Ticket 5: Email not syncing'
Ticket 'Ticket 5: Email not syncing' resolved and removed from the stack.
Ticket 'Ticket 4: Printer not working' resolved and removed from the stack.
Next ticket to resolve: 'Ticket 3: Network connectivity problem'
Ticket 'Ticket 6: Password reset' added to the stack.
Next ticket to resolve: 'Ticket 6: Password reset'
Ticket 'Ticket 6: Password reset' resolved and removed from the stack.
Ticket 'Ticket 3: Network connectivity problem' resolved and removed from the stack.
Ticket 'Ticket 2: Software installation issue' resolved and removed from the stack.
Ticket 'Ticket 1: Computer won't start' resolved and removed from the stack.

```

EXPLANATION:

1. Queue ensures fairness (first come, first served).
2. Priority Queue ensures importance (faculty first).
3. Both structures together simulate a realistic library request system.

Task 4: Hash Table

Objective

To implement a Hash Table and understand collision handling.

Task Description

Use AI to generate a hash table with:

- Insert
 - Search
 - Delete
- Starter Code class HashTable: pass

Expected Outcome

- Collision handling using chaining
- Well-commented methods

```

PS C:\Users\Eshwar\OneDrive\Desktop\python>

```

EXPLANATION:

1. Structure

A hash table uses an array of buckets. Each bucket stores a list of key–value pairs. A hash function converts a key into an index where data should be stored.

2. Collision Handling (Chaining)

If two keys map to the same index, they are stored together in that bucket's list instead of replacing each other. This method is called chaining.

3. Operations

- Insert: Hash key → go to bucket → add/update pair.
- Search: Hash key → check bucket list → return value if found. □ Delete:
Hash key → find pair in bucket → remove it.

Task 5: Real-Time Application Challenge

Scenario

Design a Campus Resource Management System with the following features:

- Student Attendance Tracking
- Event Registration System
- Library Book Borrowing
- Bus Scheduling System
- Cafeteria Order Queue Student Tasks

1. Choose the most appropriate data structure for each feature.
2. Justify your choice in 2–3 sentences.

3. Implement one selected feature using AI-assisted code generation.

Expected Outcome

- Mapping table: Feature → Data Structure → Justification
- One fully working Python implementation

9 # • Cafeteria Order Queue
10 # Student Tasks
11 # 1. Choose the most appropriate data structure for each feature.
12 # 2. Justify your choice in 2-3 sentences.
13 # 3. Implement one selected feature using AI-assisted code generation.
14 # Expected Outcome
15 # • Mapping table: Feature → Data Structure → Justification
16 # • One fully working Python implementation
17 # Mapping table: Feature → Data Structure → Justification

EXPLANATION:

1. A hash table (dictionary in Python) is chosen because it provides $O(1)$ average time complexity for both insertion and retrieval operations.
2. Each student ID is used as a key in the hash table, and the value is a list of attendance dates for that student.
3. This approach allows for efficient tracking of attendance records without needing to scan through all records every time a lookup is performed, making it scalable for large numbers of students.
